O-RINGS

O-rings are very commonly found in pumps, cylinders, connectors and valves, helping to seal joints between separate parts and prevent leaking of fluids and gases. They're used with static, dynamic, hydraulic and pneumatic components, making them an especially versatile solution to a very widespread engineering issue.

GASKET SEALS

Gasket seals a connection between two components or flanges that have flat surfaces, while seals are used between engine parts, pumps, and shafts that rotate. Gasket are used wherever a union or flange is required to prevent leaking.

DIAPHRAGMS

A rubber diaphragm is a flexible membrane that is anchored between two chambers at its periphery, moving slightly up into one chamber or down into another chamber depending on differences in pressure.
